MAP 2302 Quiz 10
Tuesday October 8th

Given the nonhomogeneous differential equation

$$y' + 2y = 12t^2$$

find a solution of the form $y = At^2 + Bt + C$ (where A, B, C are constants).

↓

$$y' = 2At + B$$

Plug into D.E.

$$\underbrace{2At + B}_{y'} + 2 \underbrace{(At^2 + Bt + C)}_y = 12t^2$$

$$\underbrace{2At}_{\text{w}} + \underbrace{B}_{\text{///}} + \underbrace{2At^2}_{\text{w}} + \underbrace{2Bt}_{\text{w}} + \underbrace{2C}_{\text{///}} = \underbrace{12t^2}_{\text{w}}$$

$$\underbrace{2At^2}_{\text{w}} + \underbrace{(2A+2B)t}_{\text{w}} + \underbrace{(B+2C)}_{\text{///}} = \underbrace{12t^2}_{\text{w}} + \underbrace{0t}_{\text{w}} + \underbrace{0}_{\text{///}}$$

$$\Rightarrow \text{(i) } 2A = 12 \quad \Rightarrow A = 6$$

$$\text{(ii) } 2A + 2B = 0 \quad \begin{matrix} \downarrow \\ 12 + 2B = 0 \end{matrix} \Rightarrow 2B = -12 \Rightarrow B = -6$$

$$\text{(iii) } B + 2C = 0 \quad \Rightarrow -6 + 2C = 0 \Rightarrow 2C = 6 \Rightarrow C = 3$$

$$y = 6t^2 - 6t + 3$$
