

NAME:

MAC2312/Quiz-3

READ ME FIRST: Show me all the magic very neatly on the page, for I do not read minds. Use correct notation when presenting your computations and arguments. Use complete sentences. Remember this: "=" denotes "equals", " \Rightarrow " denotes "implies", and " \Leftrightarrow " denotes "is equivalent to". Since the answer consists of all the magic transformations, do not "box" your final results. Eschew obfuscation.

1. (6 pts.) A particle moves with acceleration $a(t) = 2 \text{ m/s}^2$ along an s-axis and has velocity $v_0 = -2 \text{ m/s}$ at time $t = 0$. Write down the definite integrals that give the displacement and distance traveled during the time interval $0 \leq t \leq 2$ using all the information at hand, but do not attempt to evaluate the integrals.

(a) $v(t) =$

(b) Displacement =

(c) Total_Distance =

2. (3 pts.) If the given integral is expressed as an equivalent integral in terms of the variable u using the substitution $u = 1 + e^x$ so that the equation below is true, what are the numerical values of the new limits of integration α and β , and what is the new integrand, $f(u)$??? Obtain these but do not attempt to evaluate the du integral.

$$\int_0^{\ln(3)} e^x (1 + e^x)^{1/2} dx = \int_{\alpha}^{\beta} f(u) du$$

$\alpha =$ $\beta =$ $f(u) =$

3. (3 pts.) Give the definition of the function $\ln(x)$ in terms of a definite integral and give its domain and range. Label correctly. (Hint: Complete the sentence, " $\ln(x) = \dots$ ".)

4. (4 pts.) (a) Find the following derivative.

$$\frac{d}{dx} \left[\int_{\tan(x)}^3 \frac{t^2}{1+t^2} dt \right] =$$

(b) Evaluate the following limit.

$$L = \lim_{x \rightarrow \infty} \left(1 + \frac{1}{2x} \right)^x =$$

5. (4 pts.) (a) Write the solution to the following initial value problem in terms of a definite integral taken with respect to the variable t , so the differential denoting the variable of integration is dt . (b) Then reveal the true identity of y by evaluating the definite integral with respect to t .

$$\frac{dy}{dx} = \frac{1}{x \ln(x)} \quad \text{with} \quad y(e) = 1.$$

$y(x) =$
